

Sample FabricMaster SFM

It has been our goal to improve the transferability from the laboratory to sample machines and in the next step to big production machines. With the development of the Sample FabricMaster the gap between laboratory and production can be closed in a unique way.

The Sample FabricMaster with a capacity of 15 kg unites many of the features and advantages of its big sister FabricMaster. It is absolutely identical in terms of lifting distance, nozzle design and process control.

The machine distinguishes itself through an extremely compact construction – completely assembled with complete piping and wiring, the system can be connected and put into operation within a few hours.
